On the Solution of Optimization and Variational Problems with Imperfect Information

Uday V. Shanbhag (with Hao Jiang (@Illinois) and Hesam Ahmadi (@PSU))

Harold and Inge Marcus Department of Industrial and Manufacturing Engineering Pennsylvania State University University Park, PA

6th International Conference on Complementarity Problems (ICCP) Humboldt-Universität Zu Berlin Berlin August 8, 2014

A misspecified optimization problem I

A prototypical **misspecified**^{*} convex program where $\theta^* \in \mathbb{R}^m$ is misspecified:

$$\mathcal{C}(\theta^*)$$
 minimize $f(x, \theta^*)$

Generally, θ^* captures problem characteristics that may require estimation.

- Parameters of cost/price functions
- Efficiencies
- Representation of uncertainty

Generally, this is part of the model building process.

- Traditionally, a dichotomy in the roles of statisticans and optimizers
 - 1. Statisticians Learn (Build model, estimate parameters)
 - 2. Optimizers Search (Use model/parameters to obtain solution)
- Increasingly, the serial nature cannot persist.

^{*}This is parametric misspecification (as opposed to model misspecification)

Offline learning I

- One avenue lies in collecting observations a priori
- Learning problem \mathcal{L}_{θ} unaffected by the computational problem $\mathcal{C}(\theta^*)$:

Concerns:

- Exact solutions generally unavailable in finite time; solution error can be bounded in expected-value sense (at best) in stochastic regimes
- Premature termination of learning process leads to θ
 ; Error cascades into computational problem;

$$\widehat{x} \in \mathsf{SOL}(\mathcal{C}(\widehat{ heta})).$$

(中) (國) (로) (로) (로) (로) (의)

- Unclear how to develop^a implementable scheme that produces x^{*}:
 - (First-order) schemes that produce x* and θ* asymptotically
 - Non-asymptotic error bounds

^a Note that schemes that produce approximations are available based on Lipschitzian properties

An example I

$$c(x;\theta^*) \triangleq \frac{1}{2}\theta_1 x + \theta_2 x^2$$
 $c(x;\theta^*)$

Data-driven stochastic programming I

Consider the following static stochastic program

$$\min_{x \in X} \quad \mathbb{E}[f(x, \xi_{\theta^*}(\omega))], \qquad (\mathcal{C}_{\theta^*})$$

where $f : \mathbb{R}^n \times \mathbb{R}^d \to \mathbb{R}, \xi_{\theta^*} : \Omega \to \mathbb{R}^d$ and $(\Omega, \mathcal{F}, \mathbb{P}_{\theta^*})$ represents the probability space.

 Traditionally, the parameters of this distribution are estimated a priori (by MLE approaches for instance). Often a challenging problem (such as covariance selection)

Misspecified production planning problems I

The production planner solves the following problem:

$$\min_{x_{fi} \ge 0} \quad \sum_{f=1}^{N} \sum_{i=1}^{W} c_{fi}(x_{fi})$$
subject to $x_{fi} \le \operatorname{cap}_{fi}, \quad \text{for all } f, i, \quad (1)$

$$\sum_{f=1}^{N} x_{fi} = d_i.$$

・ロ ・ ・ 日 ・ ・ 王 ・ 王 = ショーののの
8/57

• Machine type *f*'s production cost at node $i c_{f_i}^{(l)}(x_{f_i}^{(l)})$ at time l, l = 1, ..., T:

$$c_{fi}^{(l)}(x_{fi}^{(l)}) = d_{fi}(x_{fi}^{(l)})^2 + h_{fi}x_{fi}^{(l)} + \xi_{fi}^{(l)}$$

The planner will solve the following problem to estimate d_{fi} and h_{fi}:

$$\min_{\{d_{f_i},h_{f_i}\}\in\Theta} \sum_{l=1}^{T} \sum_{t=1}^{N} \sum_{i=1}^{W} (d_{f_i}(x_{f_i}^{(l)})^2 + h_{f_i}x_{f_i}^{(l)} - c_{f_i}^{(l)}(x_{f_i}^{(l)}))^2.$$

A framework for learning and computation I

$$C(\theta^*)$$
 minimize $f(x, \theta^*)$

$$\mathcal{L}_{ heta}$$
 minimize $g(heta)$

Our focus is on general purpose algorithms that jointly generate sequences $\{x_k\}$ and $\{\theta_k\}$ with the following goals:

$$\lim_{k \to \infty} x_k = x^* \text{ and } \lim_{k \to \infty} \theta_k = \theta^*$$
 (Global convergence)
$$\|f(x_K, \theta_K) - f(x^*, \theta^*)\| \le \mathcal{O}(h(K)),$$
 (Rate statements)

<ロ><日><日><日</th><日><日><日</td><日><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><10</td><t

where h(K) specifies the rate.

A serial approach

- 1. Compute a solution $\tilde{\theta}$ to (\mathcal{L}_{θ})
- 2. Use solution to solve $(\mathcal{C}(\tilde{\theta}))$

Challenges:

- Given the stage-wise nature, step 1. needs to provide accurate/exact θ̃ in finite time; possible for small problems;
- In stochastic regimes, solution bounds available in expected-value sense:

$$\mathbb{E}[\|\theta_{K} - \theta^*\|^2] \leq \mathcal{O}(1/K).$$

In fact, unless the learning problem is solvable via a finite termination algorithm, asymptotic statements are unavailable

A complementarity approach

► A direct variational approach: under convexity assumptions, equilibrium conditions are given by VI(*Z*, *H*) where

$$H(z) \triangleq \begin{pmatrix} F(x,\theta) \\ \nabla_{\theta}g(\theta) \end{pmatrix}$$
 and $Z \triangleq X \times \Theta$.

Challenges:

 Problem rarely monotone and low-complexity first-order projection/stochastic approximation schemes cannot accommodate such problems.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Research questions

- First-order schemes available for solution of deterministic/stochastic convex optimization and monotone variational problems
- Can we develop analogous schemes that guarantee global/a.s. convergence[†]
- Can rate statements be provided for such schemes:
 - Are the original rates preserved?
 - What is the price of learning in terms of the modification/degradation in rates?

Outline

Part I: Deterministic problems:

- Gradient methods for smooth/nonsmooth and strongly convex/convex optimization
- Extragradient and regularization methods for monotone variational inequality problems

Part II: Stochastic problems:

- Stochastic approximation schemes for strongly convex/convex stochastic optimization with stochastic learning problems
- Regularized stochastic approximation for monotone stochastic variational inequality problems with stochastic learning problems

Literature Review

Static decision-making problems with perfect information

- Optimization: convex programming [BNO03], integer programming [NW99], stochastic programming [BL97]
- Variational inequality problems [FP03a]

Learning

Linear and nonlinear regression, support vector machines (SVMs), etc. [HTF01]

Joint schemes for related problems:

- Adaptive control [AW94], Iterative learning (tracking) control [Moo93]
- Bandit problems [Git89], regret problems [Zin03]
- Relatively less on joint schemes focusing on stylized problems in revenue management [CHdMK06, HKZ, CHdMK12]

Consider the static misspecified convex optimization problem ($C(\theta^*)$):

$$\min_{x \in X} f(x, \theta^*), \qquad (\mathcal{C}(\theta^*))$$

where $x \in \mathbb{R}^n$, $f : X \times \Theta \to \mathbb{R}$ is a convex function in x for every $\theta \in \Theta \subseteq \mathbb{R}^m$. Suppose θ^* denotes the solution to a convex learning problem denoted by (\mathcal{L}):

$$\min_{\theta \in \Theta} g(\theta), \tag{L}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

where $g : \mathbb{R}^m \to \mathbb{R}$ is a convex function in θ and is defined on a closed and convex set Θ .

Assumptions

Assumption 1

The function $f(x, \theta)$ is continuously differentiable in x for all $\theta \in \Theta$ and function g is continuously differentiable in θ .

Assumption 2

The gradient map $\nabla_x f(x; \theta)$ is Lipschitz continuous in x with constant $G_{f,x}$ uniformly over $\theta \in \Theta$ or

$$\|\nabla_x f(x_1,\theta) - \nabla_x f(x_2,\theta)\| \le G_{f,x} \|x_1 - x_2\|, \qquad \forall x_1, x_2 \in X, \quad \forall \theta \in \Theta.$$

Additionally, the gradient map $\nabla_{\theta} g$ is Lipschitz continuous in θ with constant G_{g} .

Assumption 3

Let $\{\gamma_{f,k}\}$ and $\{\gamma_{g,k}\}$ be diminishing nonnegative sequences chosen such that $\sum_{k=1}^{\infty} \gamma_{f,k} = \infty$, $\sum_{k=1}^{\infty} \gamma_{f,k}^2 < \infty$, $\sum_{k=1}^{\infty} \gamma_{g,k} = \infty$, and $\sum_{k=1}^{\infty} \gamma_{g,k}^2 < \infty$.

Constant steplength schemes for strongly convex problems I

Assumption 4

The function f is strongly convex in x with constant η_f for all $\theta \in \Theta$ and the function g is strongly convex with constant η_g .

Assumption 5

The gradient $\nabla_x f(x^*, \theta)$ is Lipschitz continuous in θ with constant L_{θ} .

Proposition 1 (Rate analysis in strongly convex regimes)

Let Assumptions 1, 2, 4 and 5 hold. In addition, assume that γ_f and γ_g are chosen such that $\gamma_f \leq \min(2\eta_f/G_{f,x}^2, 1/L_{\theta})$ and $\gamma_g \leq 2/G_g$. Let $\{x_k, \theta_k\}$ be the sequence generated by Algorithm 1. Then for every $k \geq 0$, we have the following:

$$||x_{k+1} - x^*|| \le q_x^{k+1} ||x_0 - x^*|| + kq_\theta q^k ||\theta_0 - \theta^*||,$$

where $q_x \triangleq (1 + \gamma_f^2 G_{f,x}^2 - 2\gamma_f \eta_f)^{1/2}$, $q_\theta \triangleq \gamma_f L_\theta$, $q_g \triangleq (1 + \gamma_g^2 G_g^2 - 2\gamma_g \eta_g)^{1/2}$, and $q \triangleq \max(q_x, g_g)$.

Constant steplength schemes for strongly convex problems II

Remark: Notably, learning leads to a degradation in the convergence rate from the standard **linear** rate to a **sub-linear** rate. Furthermore, it is easily seen that when we have access to the true θ^* , the original rate may be recovered.

Figure 1 : Strongly convex problems and learning: Constant steplength (I) and Diminishing steplength (r)

・・・・<・<・<・<・・

Constant steplength schemes for strongly convex problems III

Figure 2 : Strongly convex optimization and learning: Impact on rate (I) and empirical vs. theor. rate (r)

¹ We provide some numerics on a small production planning problem with 5 plants with capacity and ramping requirements. We assume that either cost is misspecified (Opt) or demand is misspecified (VIs).

Misspecified convex optimization I

Assumption 6

The function f is convex in x with constant η_f for all $\theta \in \Theta$ and the function g is strongly convex with constant η_g .

Assumption 7

- (a) The sets X and Θ are compact and sup_{x∈X} ||x|| ≤ C, where C is a constant.
- (b) The gradient map ∇_xf(x; θ) is uniformly Lipschitz continuous in θ with constant G_{f,θ}:

$$\|
abla_x f(x, heta_1) -
abla_x f(x, heta_2)\| \leq G_{f, heta} \| heta_1 - heta_2\|, \quad orall heta_1, heta_2 \in \Theta, x \in X.$$

・・・<l

Assumption 8

There exists a constant $L_{f,\theta}$ such that $|f(x,\theta_1) - f(x,\theta_2)| \le L_{f,\theta} ||\theta_1 - \theta_2||, \quad \forall \theta_1, \theta_2 \in \Theta, x \in X.$

Proposition 2 (Constant steplength scheme with averaging)

Let Assumptions 1, 2, 6, 7 and 8 hold and stepsizes $\gamma_{f,k}$ and $\gamma_{g,k}$ be fixed at constants γ_f and γ_g so that $0 < \gamma_g < 2/G_g$ and $0 < \gamma_f \le 1/G_{f,x}$. Let the sequence $\{x_k, \theta_k\}$ be generated by Algorithm 1 and suppose \bar{x}_k is defined as

$$ar{\mathbf{x}}_k \triangleq rac{\displaystyle\sum_{i=0}^{k-1} \mathbf{x}_{i+1}}{k}.$$

Then the following hold:

(i) In addition, if $a_x = \frac{\|x_0 - x^*\|^2}{2\gamma_f}$, $a_\theta \triangleq \|\theta_0 - \theta^*\|$, and $b_\theta \triangleq \frac{CG_{f,\theta}}{1 - q_g}$, then the following holds:

$$|f(\bar{x}_{K},\theta_{K})-f(x^{*},\theta^{*})|\leq \frac{a_{x}}{K}+a_{\theta}\left(\frac{b_{\theta}}{K}+L_{f,\theta}q_{g}^{K}\right)$$

(ii) $\lim_{k\to\infty} f(\bar{x}_k,\theta_k) = f(x^*,\theta^*).$

Misspecified convex optimization III

Remarks:

- Unlike in the case of strongly convex optimization, there is **no** degradation in the standard rate of convergence in function values which is O(1/K).
- Contribution from learning is given by

$$\|\theta_0 - \theta^*\| \left(L_{f,\theta} q_g^K + \frac{b_{\theta}}{K}
ight).$$

Some intuition:

- The first term arises from the effort to learn the correct θ*
- The second term is an interaction term between x and θ through L_{f,θ} and is mitigated by averaging

・・・<l

- Both terms are scaled by $\|\theta_0 \theta^*\|$.
- The overall rate does not degrade (but gets modified)

Misspecified convex optimization IV

Nonsmooth convex optimization I

Assumption 9

The function g is continuously differentiable in θ , strongly convex, and the gradient map $\nabla_{\theta} g(\theta)$ is Lipschitz continuous in θ with constant G_g .

Assumption 10 (Subgradient boundedness)

There exists an M > 0 such that $||d_k|| \le M$ for all $d_k \in \partial f(x_k, \theta_k)$ and for all $\theta_k \in \Theta$.

Assumption 11

There exists a constant $L_{f,\theta}$ such that $|f(x,\theta_1) - f(x,\theta_2)| \le L_{f,\theta} \|\theta_1 - \theta_2\| \quad \forall \theta_1, \theta_2 \in \Theta, x \in X.$

We consider the following subgradient-based analog of Algorithm 1:

Algorithm 2 (Joint subgradient scheme)Given an $x_0 \in X$ and $a \theta_0 \in \Theta$ and sequences $\{\gamma_{f,k}, \gamma_{g,k}\}$, then $x_{k+1} := \prod_X (x_k - \gamma_{f,k} d_k),$ $\forall k \ge 0,$ $\theta_{k+1} := \prod_\Theta (\theta_k - \gamma_{g,k} \nabla_\theta g(\theta_k)),$ $\forall k \ge 0,$ where $d_k \in \partial f(x_k, \theta_k).$

wł

Proposition 3 (Rate analysis with averaging)

Let Assumptions 9, 10, and 11 hold. Let $\gamma_{g,k}$ be fixed at γ_g such that $0 < \gamma_g < 2/G_g$. Consider the sequence $\{x_k, \theta_k\}$ generated by Algorithm 2 and $\bar{x}_k \triangleq \frac{\sum_{k=0}^{k} \gamma_{f,i} x_i}{\sum_{k=0}^{k} \gamma_{f,i}}$. Then the following hold:

(i) If $\gamma_{f,k}$ is defined based on Assumption 3 with $\gamma_{f,0} \leq 2\eta_f/G_{f,x}^2$ and $\gamma_g \leq 2/G_g$, then

$$\lim_{k\to\infty}|f(\bar{x}_k,\theta_k)-f(x^*,\theta^*)|=0.$$

(ii) Suppose Algorithm 2 is to be terminated after K iterations and γ_f (the optimal constant steplength) is defined as γ_{f,K} = ^{||x₀-x^{*}||}/_{M√K+1}, then

$$|f(\bar{x}_{K},\theta_{K})-f(x^{*},\theta^{*})| \leq \frac{d_{x}}{\sqrt{K+1}} + d_{\theta}\left(L_{f,\theta}q_{g}^{K}+\frac{c_{\theta}}{(K+1)}\right),$$

where $d_{x} = M||x_{0}-x^{*}||, d_{\theta} = ||\theta_{0}-\theta^{*}||, and c_{\theta} = 2L_{f,\theta}/(1-q_{\theta}).$

Nonsmooth convex optimization III

Remark: Standard subgradient methods for convex optimization display a convergence rate of $O(1/\sqrt{K})$ in function value [BV04] using optimal constant steplength [SDR09]

- Joint scheme shows no degradation in the rate, not even in a constant factor sense.
- Modification in the rate is given by

$$\| heta_0 - heta^*\| \left(L_{f, heta} q_g^K + rac{b_ heta}{K}
ight).$$

<ロ> < 回 > < 回 > < 三 > < 三 > 三 三 39.69

Identical to the smooth case

Nonsmooth convex optimization IV

Misspecified variational inequality problems I

The misspecified optimization problem is now generalized to a variational inequality problem:

$$(y - x)^T F(x; \theta^*) \ge 0, \qquad \forall y \in X.$$
 $(\mathcal{V}(\theta^*))$

Assumption 12

- (a) The function g is differentiable, strongly convex with constant η_g , and Lipschitz continuous in gradient with constant G_g .
- (b) The map F is monotone in x and uniformly Lipschitz continuous in x and θ with constants L_{F,x} and L_{F,θ}, respectively:

$$\begin{aligned} \|F(x_1;\theta) - F(x_2;\theta)\| &\leq L_{F,x} \|x_1 - x_2\| \quad \forall x_1, x_2 \in X, \quad \forall \theta \in \Theta, \\ \|F(x,\theta_1) - F(x,\theta_2)\| &\leq L_{F,\theta} \|\theta_1 - \theta_2\| \quad \forall \theta_1, \theta_2 \in \Theta, \quad \forall x \in X. \end{aligned}$$

Extragradient schemes I

Algorithm 3 (A joint extragradient scheme) Given an $x_0 \in X$ and a $\theta_0 \in \Theta$ and a steplength τ ,				
$z_{k+1} := \prod_{X} (x_k - \tau F(x_k; \theta_k))$	$\forall k > 0,$	$(Extra_x(\theta_k))$		
$egin{aligned} & X_{k+1} := \Pi_X(x_k - au F(z_{k+1}; heta_k)) \ & heta_{k+1} := \Pi_\Theta(heta_k - \gamma_g abla_ heta g(heta_k)) \end{aligned}$	$\forall k > 0,$ $\forall k > 0.$	$(Extra_{z}(\theta_{k}))$ (Learn)		

Theorem 1 (Convergence of extragradient scheme)

Let Assumption 12 holds and Θ is bounded. In addition, assume that stepsize $\gamma_{g,k}$ is fixed at γ_g , where $\gamma_g \leq \frac{2}{G_g}$. Let $\{x_k, \theta_k\}$ be the sequence generated by Algorithm 3 with

$$\tau^2 \leq \frac{1}{L_{F,x}^2 + L_{F,\theta} \|\theta_0 - \theta^*\|}.$$

Then, $\{x_k\}$ converges to a point in X^* and $\{\theta_k\}$ converges to $\theta^* \in \Theta$ as $k \to \infty$.

Extragradient schemes II

Remark:

- ▶ Standard extragradient methods require that $\tau \leq \frac{1}{L_{f_x}}$ (cf. [FP03b]).
- This variant requires that

$$\tau \leq \sqrt{\frac{1}{L_{f,x}^2 + L_{f,\theta} \|\theta_0 - \theta^*\|}}.$$

• When $\theta_0 = \theta^*$, we recover the original result.

Iteratively (Tikhonov) regularized schemes I

- Tikhonov regularization techniques [Tik63, TA76, FP03b] have proved useful in solving monotone variational inequality problems.
- Specifically, such techniques construct a sequence $\{x_k\}$ where

$$x_k = \prod_X (x_k - \gamma_k (F(x_k) + \epsilon_k x_k)), \quad \forall k \ge 0$$

implying that $x_k \in SOL(X, F + \epsilon_k \mathbf{I})$, where $\{\epsilon_k\} \to 0$ and $\{x_k\} \to x^* \in X^*$.

- Challenge: obtaining x_k requires solving a strongly monotone VI exactly (or with increasing accuracy) at every step
- An alternative lies in using *iterative* Tikhonov regularization where a projected gradient step is taken at every step [Pol87, KS10]

$$x_{k+1} := \Pi_X(x_k - \gamma_k(F(x_k) + \epsilon_k x_k)), \quad \forall k \ge 0.$$

Under suitable assumptions of $\{\gamma_k, \epsilon_k\}$, convergence can be recovered.

• We consider an extension of this scheme to the misspecified regime.

Algorithm 4 (A regularized projection scheme)Given an $x_0 \in X$ and $\theta_0 \in \Theta$ and sequences $\{\gamma_{t,k}\}$ and $\{\epsilon_k\}$, $x_{k+1} := \Pi_X (x_k - \gamma_{t,k}(F(x_k, \theta_k) + \epsilon_k x_k)))$ $\forall k > 0$, (Var (θ_k, ϵ_k)) $\theta_{k+1} := \Pi_\Theta (\theta_k - \gamma_{g,k} \nabla_\Theta g(\theta_k))$ $\forall k > 0$. (Learn)

2757

Iteratively (Tikhonov) regularized schemes II

In our analysis, we consider two auxiliary sequences $\{x_k^t\}$ and $\{z_k^t\}$, defined as follows:

$$x_k^t := \Pi_X(x_k^t - \gamma_{f,k}(F(x_k^t, \theta_k) + \epsilon_k x_k^t)) \quad \forall k > 0,$$
 (Tik(θ_k))

$$Z_k^t := \Pi_X(Z_k^t - \gamma_{t,k}(F(Z_k^t, \theta^*) + \epsilon_k Z_k^t)) \quad \forall k > 0.$$
 (Tik(θ^*))

- $\{z_k^t\}$ is the Tikhonov trajectory under perfect information (θ^* is known)
- $\{x_k^t\}$ is the Tikhonov trajectory under belief θ_k
- ▶ Proof of convergence shows that $||x_k x_k^t|| \to 0$ as $k \to \infty$ and $||x_k^t z_k^t|| \to 0$ as $k \to \infty$.
- Crucial Lemma:

Lemma 1

Let Assumptions 12, 13 and 14(d) hold. Suppose x_k^t and x_{k-1}^t are defined by Tik(θ_k) and Tik(θ_{k-1}) respectively. Then, we have that $||x_k^t - x_{k-1}^t||$ can be bounded as follows:

$$\|\boldsymbol{x}_{k}^{t}-\boldsymbol{x}_{k-1}^{t}\| \leq \frac{L_{F,\theta}\boldsymbol{q}_{g}^{k-1}\boldsymbol{C}_{g}}{\epsilon_{k}} + \frac{M}{\epsilon_{k}}|\epsilon_{k-1}-\epsilon_{k}|,$$

where $q_g \triangleq \sqrt{1 - 2\gamma_g \eta_g + \gamma_g^2 G_g^2}$, $C_g \triangleq \|\theta_0 - \theta^*\|(1 + q_g)$, and M is the constant defined in Assumption 13.

Iteratively (Tikhonov) regularized schemes III

Assumption 13

The set X is compact and $\sup_{x \in X} ||x|| \le M$, where M is a constant.

Assumption 14

The following hold:

(a)
$$0 < \gamma_{t,k} \leq \frac{\epsilon_k}{(L_{F,x}+\epsilon_k)^2} \leq \frac{\epsilon_0}{L_{F,x}^2}$$
 for all k ;
(b) $\gamma_{t,k}\epsilon_k < 1$ and $\sum_{k=1}^{\infty} \gamma_{t,k}\epsilon_k = \infty$;
(c) $\lim_{k\to\infty} \frac{|\epsilon_{k-1}-\epsilon_k|}{\gamma_{t,k}\epsilon_k^2} = 0$;
(d) $\gamma_{g,k} \triangleq \gamma_g$ such that $\gamma_g \leq 2\eta_g/G_g^2$ and $\lim_{k\to\infty} \frac{q_g^{k-1}}{\gamma_{t,k}\epsilon_k^2} = 0$, where $q_g \triangleq \sqrt{1-2\gamma_{g,k}\eta_g + \gamma_{g,k}^2G_g^2}$.

Theorem 2 (Convergence of regularized scheme)

Let Assumptions 12, 13 and 14 hold. Consider the sequence $\{x_k, \theta_k\}$ generated by Algorithm 4. Then, $\{x_k\}$ converges to x^* as $k \to \infty$, where x^* denotes the least-norm solution of X^* and $\{\theta_k\}$ converges to $\theta^* \in \Theta$.

Introduction of uncertainty I

- Computational problem: We consider the stochastic generalization of optimization/variational inequality problems.
- Specifically, such a problem requires an $x^* \in X$ such that

$$(x - x^*)^T \mathbb{E}[F(x^*; \theta^*, \xi(\omega))] \ge 0, \quad \forall x \in X, \quad (\mathsf{P}_x(\theta^*))$$

where $\xi : \Omega \to \mathbb{R}^d$, $F : X \times \mathbb{R}^d \to \mathbb{R}^n$, $X \subseteq \mathbb{R}^n$, and $(\Omega, \mathcal{F}, \mathbb{P})$ denotes the probability space

• Learning problem: The vector θ^* lies in the solution set of (P_{θ}):

$$\min_{\theta \in \Theta} g(\theta), \text{ where } g(\theta) \triangleq \mathbb{E}[g(\theta; \eta)]. \tag{P}_{\theta}$$

Algorithm 5 (**Coupled SA schemes for stochastic opt. problems**) Step 0. Given $x_0 \in X$, $\theta_0 \in \Theta$ and sequences $\{\gamma_{k,x}, \gamma_{k,\theta}\}$, k := 0Step 1.

$$x^{k+1} := \Pi_X \left(x^k - \gamma_{k,x} (\nabla_x f(x^k; \theta^k) + w^k) \right), \qquad k \ge 0$$
 (Opt_k)

$$\theta^{k+1} := \Pi_{\Theta} \left(\theta^k - \gamma_{k,\theta} (\nabla_{\theta} g(\theta^k) + v^k) \right), \qquad k \ge 0 \qquad (\text{Learn}_k)$$

<ロト < 回 > < 回 > < 回 > < 回 > 三目目 の

 $w^k \triangleq \nabla_x f(x^k; \theta^k, \xi^k) - \nabla_x f(x^k; \theta^k)$ and $v^k \triangleq \nabla_\theta g(\theta^k; \eta^k) - \nabla_\theta g(\theta^k)$. **Step 2.** If k > K, stop; else k : k + 1, go to Step. 1.

Assumptions

Assumption 1 (Problem properties, A1-1)

Suppose the following hold:

- (i) For every θ ∈ Θ, f(x; θ) is strongly convex (μ_x) and continuously differentiable with Lipschitz continuous gradients (L_x) in x.
- (ii) For every $x \in X$, the gradient $\nabla_x f(x; \theta)$ is Lipschitz continuous in θ with constant L_{θ} .
- (iii) The function $g(\theta)$ is strongly convex and continuously differentiable with Lipschitz continuous gradients in θ with convexity constant μ_{θ} and Lipschitz constant C_{θ} , respectively.

Assumption 2 (Steplength requirements, A2-1)

Let $\{\gamma_{k,x}\}$ and $\{\gamma_{k,\theta}\}$ be chosen such that $\sum_{k=0}^{\infty} \gamma_{k,x} = \infty$, $\sum_{k=0}^{\infty} \gamma_{k,x}^2 < \infty$ and $\gamma_{k,\theta} = \gamma_{k,x} L_{\theta}^2 / (\mu_x \mu_{\theta})$.

Assumption 3 (A3)

[§] Let the following hold: $\mathbb{E}[w^k | \mathcal{F}_k] = 0$ and $\mathbb{E}[v^k | \mathcal{F}_k] = 0$ a.s. for all *k*. Furthermore, $\mathbb{E}[||w^k||^2 | \mathcal{F}_k] \le \nu_x^2$ and $\mathbb{E}[||v^k||^2 | \mathcal{F}_k] \le \nu_\theta^2$ a.s. for all *k*.

[§]We define a new probability space $(Z, \mathcal{F}, \mathbb{P})$, where $Z \triangleq \Omega \times \Lambda$, $\mathcal{F} \triangleq \mathcal{F}_X \times \mathcal{F}_\theta$ and $\mathbb{P} \triangleq \mathbb{P}_X \times \mathbb{P}_\theta$. We use \mathcal{F}_k to denote the sigma-field generated by the initial points (x^0, θ^0) and errors (w^I, v^I) for $I = 0, 1, \cdots, k - 1$, i.e., $\mathcal{F}_0 = \{(x^0, \theta^0)\}$ and $\mathcal{F}_k = \{(x^0, \theta^0), ((w^I, v^I), I = 0, 1, \cdots, k - 1)\}$ for $k \ge 1$. We make the following assumptions on the filtration and errors $\mathbb{P} = \{x^0, \theta^0\}$.

Main results

Proposition 4 (Almost-sure convergence under strong convexity of f)

Suppose (A1-1), (A2-1) and (A3) hold. Let $\{x^k, \theta^k\}$ be computed via Algorithm 5. Then, $x^k \to x^*$ and $\theta^k \to \theta^*$ a.s. as $k \to \infty$, where x^* denotes the unique solution to $(\mathsf{P}_x(\theta^*))$.

- Proof relies on super-martingale convergence theorem
- Surpising aspects:
 - > The steplength sequences run on the same timescale; merely scaled variants
 - The overall variational problem in (x, θ) is not necessarily monotone but can be solved[¶]; what does this suggest regard the solution of more general complementarity/equilibrium/variational problems

[¶]No available schemes for solving non-monotone stochastic variational inequality problems < 🚊 > < 🚊 > 📖 📼

Weakening strong convexity of (P_x)

Assumption 4 (A1-2)

Suppose the following holds in addition to (A1-1 (ii)) and (A1-1 (iii)) For every $\theta \in \Theta$, $f(x; \theta)$ is convex and continuously differentiable with Lipschitz continuous gradients in x with Lipschitz constant L_x .

Furthermore, we make the following assumptions on the steplength sequences employed in the algorithm.

Assumption 5 (A2-2)

Let $\{\gamma_{k,x}\}$, $\{\gamma_{k,\theta}\}$ and some constant $\tau \in (0, 1)$ be chosen such that $\sum_{k=0}^{\infty} \gamma_{k,x}^{2-\tau} < \infty$ and $\sum_{k=0}^{\infty} \gamma_{k,\theta}^{2} < \infty$, $\sum_{k=0}^{\infty} \gamma_{k,x} = \infty$ and $\sum_{k=0}^{\infty} \gamma_{k,\theta} = \infty$, $\beta_{k} = \frac{\gamma_{k,x}^{\tau}}{2\gamma_{k,\theta}\mu_{\theta}} \downarrow 0$ as $k \to \infty$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Proceeding as in the previous result, we present a convergence result under these weakened conditions.

Theorem 2 (Almost-sure convergence under convexity of f)

Suppose (A1-2), (A2-2) and (A3) hold. Suppose X is bounded and the solution set X^* of $(P_x(\theta^*))$ is nonempty. Let $\{x^k, \theta^k\}$ be computed via Algorithm 5. Then, $\theta^k \to \theta^*$ a.s. as $k \to \infty$, and x^k converges to a random point in X^* a.s. as $k \to \infty$.

Notably, in merely convex regimes, $\gamma_{k,x}$ and $\gamma_{k,\theta}$ are run at differing timescales; specifically, $\gamma_{k,x} \to 0$ at a faster rate than $\gamma_{k,\theta} \to 0$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Rate estimates I

Proposition 5 (Rate estimates for strongly convex f) Suppose (A1-1) and (A3) hold.^a Let { x^k , θ^k } be computed via Algorithm 5. Then, the following hold: $\mathbb{E}[\|\theta^k - \theta^*\|^2] \leq \frac{Q_{\theta}(\lambda_{\theta})}{k} \text{ and } \mathbb{E}[\|x^k - x^*\|^2] \leq \frac{Q_x(\lambda_x)}{k},$ where $Q_{\theta}(\lambda_{\theta}) \triangleq \max \left\{ \lambda_{\theta}^2 M_{\theta}^2 (2\mu_{\theta}\lambda_{\theta} - 1)^{-1}, \mathbb{E}[\|\theta^1 - \theta^*\|^2] \right\},$ $Q_x(\lambda_x) \triangleq \max \left\{ \lambda_x^2 \widetilde{M}^2 (\mu_x \lambda_x - 1)^{-1}, \mathbb{E}[\|x^1 - x^*\|^2] \right\},$ and $\widetilde{M} \triangleq \sqrt{M^2 + \frac{L_{\theta}^2 Q_{\theta}(\lambda_{\theta})}{\mu_x \lambda_x}}.$

^aSuppose $\gamma_{x,k} = \lambda_x/k$ and $\gamma_{\theta,k} = \lambda_{\theta}/k$ with $\lambda_x > 1/\mu_x$ and $\lambda_{\theta} > 1/(2\mu_{\theta})$. Let $\mathbb{E}[\|\nabla_x f(x^k; \theta^k) + w^k\|^2] \le M^2$ and $\mathbb{E}[\|\nabla_\theta g(\theta^k) + v^k\|^2] \le M^2_{\theta}$ for all $x^k \in X$ and $\theta^k \in \Theta$.

 Under strong convexity, optimization and learning recovers optimal rate of SA

<ロ> < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

▶ Naturally, when $\theta_1 = \theta^*$, we recover the original optimization result

Rate estimates II

Theorem 3 (Rate estimates under convexity of f)

Suppose (A1-2) and (A3) hold.^{*a*} Let { x^k , θ^k } be computed via Algorithm 5.^{*b*}Then the following holds for $1 \le i \le k$:

$$\mathbb{E}[|f(\tilde{x}_{i,k};\theta^k) - f(x^*;\theta^*)|] \leq \frac{\sqrt{Q_{\theta}(\lambda_{\theta})}D_{\theta} + C_{i,k}\sqrt{B_k}}{\sqrt{k}},$$

where $C_{i,k} = \frac{k}{k-i+1}$ and $B_k = (4D_X^2 + L_{\theta}^2 Q_{\theta}(\lambda_{\theta})(1 + \ln k))(M^2 + M_X^2)$.

 $\begin{array}{l} \overset{a}{\operatorname{Suppose} \mathbb{E}[\|x^{k} - x^{*}\|^{2}] \leq M_{x}^{2}, \mathbb{E}[\|\nabla_{x}f(x^{k};\theta^{k}) + w^{k}\|^{2}] \leq M^{2} \text{ and } \mathbb{E}[\|\nabla_{\theta}g(\theta^{k}) + v^{k}\|^{2}] \leq M^{2}_{\theta} \text{ for all } x^{k} \in X \text{ and } \theta^{k} \in \Theta. \\ \overset{b}{\operatorname{For } 1 \leq i, t \leq k, \text{ we define } v_{t} \triangleq \frac{\gamma_{x,t}}{\sum_{s=i}^{k} \gamma_{x,s}}, \tilde{x}_{i,k} \triangleq \sum_{l=i}^{k} v_{l}x^{l} \text{ and } D_{\chi} \triangleq \max_{x \in X} \|x - x^{1}\|. \text{ Suppose for } 1 \leq t \leq k \gamma_{x} = \sqrt{\frac{4D_{\chi}^{2} + \mathcal{L}_{\theta}^{2} \mathcal{Q}_{\theta}(\lambda_{\theta})(1 + \ln k)}{(M^{2} + M_{\chi}^{2})k}}, \text{ where } \mathcal{Q}_{\theta}(\lambda_{\theta}) \triangleq \max\left\{\lambda_{\theta}^{2} \mathcal{M}_{\theta}^{2}(2\mu_{\theta}\lambda_{\theta} - 1)^{-1}, \mathbb{E}[\|\theta^{1} - \theta^{*}\|^{2}]\right\}, \\ \operatorname{and } \gamma_{\theta,k} = \lambda_{\theta}/k \text{ with } \lambda_{\theta} > 1/(2\mu_{\theta}). \end{array}$

- Averaging in stochastic convex optimization leads to $O(1/\sqrt{k})$
- Averaging with learning leads to bound given loosely by $O\left(\sqrt{\ln(k)}/\sqrt{k}\right)$.

<ロ> < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

• Degradation in learning is $O\left(\sqrt{\ln(k)}\right)$.

Constant steplength error bounds

In many multiagent systems, constant steplengths (or gain sequences) are convenient; can one quantify these errors?

Proposition 6 Suppose (A3) holds. Suppose $\gamma_{\theta,k} = \gamma_{x,k} := \gamma$. Suppose $\mathbb{E}[||x^k - x^*||^2] \le M_r^2$ and $\mathbb{E}[\|\nabla_x f(x^k; \theta^k) + w^k\|^2] \le M^2$ for all $x^k \in X$. Suppose $A_k \triangleq \frac{1}{2} \|x^k - x^*\|^2$ and $a_k \triangleq \mathbb{E}[A_k]$. Let $\{x^k, \theta^k\}$ be computed via Algorithm 5. Suppose (A1-1) holds. Then, the following holds: $\limsup_{k \to \infty} a_k \leq \frac{1}{2\mu_x} \gamma M^2 + \frac{L_{\theta}^2}{2\mu_x^2} \frac{\gamma \nu_{\theta}^2}{(2\mu_\theta - \gamma C_{\theta}^2)}.$ Suppose (A1-2) holds. Then, the following holds: $\limsup |\mathbb{E}[f(x^k; \theta^k) - f(x^*; \theta^*)]| \le \frac{1}{2}\gamma M^2 + \frac{1}{2}\gamma^{1-\tau} M_x^2$ $k \rightarrow \infty$ $+\frac{\gamma^{\prime}\nu_{\theta}^{2}L_{\theta}^{2}}{4\mu_{\theta}-2\gamma C_{\phi}^{2}}+D_{\theta}\sqrt{\frac{\gamma\nu_{\theta}^{2}}{2\mu_{\theta}-\gamma C_{\phi}^{2}}}$ Degradation from learning where $0 < \tau < 1$.

► Utility of this result; we've set $\gamma_x = \gamma_\theta$; But we may optimize this error bound in the choices of steplengths

Summary of rate statements

	Computation	Computation & Learning

We begin by stating an assumption similar to (A1-1) on the mapping F.

Assumption 6 (A1-3)

(Identical to A1-1) with $\nabla f(x; \theta)$ replaced by $F(x; \theta)$

Main results I

Proposition 7 (Almost-sure convergence under strongly monotone *F*) Suppose (A1-3), (A2-1) and (A3) hold. Let $\{x^k, \theta^k\}$ be computed via Algorithm 6. Then, $x^k \to x^*$ a.s. and $\theta^k \to \theta^*$ a.s. as $k \to \infty$, where x^* is the unique solution to $VI(X, F(\bullet; \theta^*))$.

・・<li

Result is similar to that for strongly convex problems

Main results II

Algorithm 7 (Coupled regularized SA schemes for stochastic VIs) Step 0. Given $x_0 \in X, \theta_0 \in \Theta$ and sequences $\{\gamma_{k,x}, \gamma_{k,\theta}, \epsilon_k\}, k := 0$ Step 1. $x^{k+1} := \prod_X \left(x^k - \gamma_{k,x}(F(x^k; \theta^k) + \underbrace{\epsilon_k x^k}_{\text{Tikhonov regular.}} + w^k) \right)$ (Comp_k) $\theta^{k+1} := \prod_\Theta \left(\theta^k - \gamma_{k,\theta}(G(\theta^k) + v^k) \right),$ (Learn_k) where $w^k \triangleq F(x^k; \theta^k, \xi^k) - F(x^k; \theta^k)$ and $v^k \triangleq G(\theta^k; \eta^k) - G(\theta^k)$. Step 2. If k > K, stop; else k : k + 1, go to Step. 1.

 Unlike in optimization, we need to employ a Tikhonov regularizer, inspired by past work [KNS13]

Assumptions

The following assumptions will be made on both the decision variable and parameter.

Assumption 7 (A1-4)

(Similar to A1-3)

We also make the following assumptions on the steplength sequences employed in the algorithm.

Assumption 8 (A2-3)

Let $\{\gamma_{k,x}\}, \{\gamma_{k,\theta}\}, \{\epsilon_k\}$ and some constant $\tau \in (0, 1)$ be chosen such that:

(i) $\sum_{k=0}^{\infty} \gamma_{k,x}^{2-\tau} < \infty$ and $\sum_{k=0}^{\infty} \gamma_{k,\theta}^{2} < \infty$, (ii) $\sum_{k=0}^{\infty} \gamma_{k,x} \epsilon^{k} = \infty$ and $\sum_{k=0}^{\infty} \gamma_{k,\theta} = \infty$, (iii) $\beta_{k} = \frac{\gamma_{k,x}^{\tau}}{2\gamma_{k,\theta}\mu_{\theta}} \downarrow 0$ as $k \to 0$. (iv) $\sum_{k=0}^{\infty} \frac{(\epsilon_{k-1} - \epsilon_{k})}{\epsilon_{k}} < \infty$.

Main results

Theorem 4 Suppose (A1-4), (A2-3) and (A3) hold. Suppose *X* is bounded and the solution set *X*^{*} of VI(*X*, *F*(\bullet , θ^*)) is nonempty. Let {*x^k*, θ^k } be computed via Algorithm 7. Then, $\theta^k \to \theta^*$ *a.s.* as $k \to \infty$, and x^k converges to the least norm solution in *X*^{*} *a.s.* as $k \to \infty$.

- Again, $\gamma_{k,x}$ and $\gamma_{k,\theta}$ are decreased at different rates
- Unlike in the optimization setting, we recover the least-norm solution

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Rate estimates I

- In the strongly monotone regime, we may recover the optimal rate of SA
- Without strong monotonicity, one avenue lies in averaging and working in a weak sharp regime; specifically, we assume that VI(X, E[F(•; θ*, ξ)]) possesses the MPS property, which is introduced in the following lemma.

Lemma 3

[Mar93] Let $H : X \to \mathbb{R}^n$ be a mapping that is monotone over the compact polyhedral set *X*. Let *X*^{*} be the solution set of VI(*X*, *H*)^{||} and there exists a positive number α s.t.

$$(x - x^*)^T H(x^*) \ge \alpha \operatorname{dist}(x, X^*), \quad \forall x \in X, \quad \forall x^* \in X^*,$$

where dist $(x, X^*) \triangleq \min_{x^* \in X^*} ||x - x^*||$.

Rate estimates II

Theorem 5 (**Rate estimates under monotonicity of** *F*) Suppose (A1-4) and (A3) hold.^{*a*} Let { x^k , θ^k } be computed via Algorithm 6. ^{*b*} Then there exists a positive number α such that for $1 \le i \le k$:

$$\mathbb{E}\left[\alpha \operatorname{dist}(\tilde{x}_{i,k}, X^*)\right] \leq C_{i,k} \sqrt{\frac{B_k}{k}}$$

where $C_{i,k} = \frac{k}{k-i+1}$ and $B_k = (4D_X^2 + L_\theta^2 Q_\theta(\lambda_\theta)(1 + \ln k))(M^2 + M_x^2)$.

$$\begin{split} ^{a} \text{Suppose } \mathbb{E}[\|x^{k} - x^{*}\|^{2}] &\leq M_{x}^{2}, \mathbb{E}[\|F(x^{k};\theta^{k}) + w^{k}\|^{2}] \leq M^{2} \text{ and } \mathbb{E}[\|G(\theta^{k}) + v^{k}\|^{2}] \leq M^{2} \theta^{k} \text{ for all } x^{k} \in X \\ \text{and } \theta^{k} \in \Theta. \text{ Suppose } X \text{ is a compact polyhedral set, the solution set } X^{*} \text{ of } VI(X, \mathbb{E}[F(\bullet;\theta^{*},\xi)]) \text{ is nonempty, and} \\ x^{*} \text{ is a point in } X^{*}. \text{ Suppose } VI(X, \mathbb{E}[F(\bullet;\theta^{*},\xi)]) \text{ possesses the MPS property.} \\ ^{b} \text{For } 1 \leq i, t \leq k, \text{ we define } v_{t} \triangleq \frac{\gamma^{k} x_{t}}{\sum_{s=i}^{k} \gamma^{x,s}}, \tilde{x}_{i,k} \triangleq \sum_{t=i}^{k} v_{t} x^{t} \text{ and } D_{X} \triangleq \max_{x \in X} \|x - x^{1}\|. \text{ Suppose for } 1 \leq t \leq k \gamma_{x} = \sqrt{\frac{4D_{X}^{2} + L_{\theta}^{2} Q_{\theta}(\lambda_{\theta})(1+\ln k)}{(M^{2} + M_{X}^{2})k}}, \text{ where } Q_{\theta}(\lambda_{\theta}) \triangleq \max \left\{\lambda_{\theta}^{2} M_{\theta}^{2} (2\mu_{\theta}\lambda_{\theta} - 1)^{-1}, \mathbb{E}[\|\theta^{1} - \theta^{*}\|^{2}]\right\}, \\ \text{ and } \gamma_{\theta,k} = \lambda_{\theta}/k \text{ with } \lambda_{\theta} > 1/(2\mu_{\theta}). \end{split}$$

- Akin to merely convex regimes, averaging allows for prescribing rates
- Degradation from learning is $O\left(\sqrt{\ln(k)}\right)$.

Constant steplength errors

wh

Proposition 8 Suppose (A3) holds. Suppose $\gamma_{\theta,k} = \gamma_{x,k} := \gamma_x$. Suppose $\mathbb{E}[||x^k - x^*||^2] \le M_x^2$ and $\mathbb{E}[F(x^k; \theta^k) + w^k||^2] \le M^2$ for all $x^k \in X$. Suppose $A_k \triangleq \frac{1}{2} ||x^k - x^*||^2$ and $a_k \triangleq \mathbb{E}[A_k]$. Suppose X is a compact polyhedral set, the solution set X^* of VI(X, $F(\bullet, \theta^*)$) is nonempty, and x^* is a point in X^* . Suppose VI(X, $F(\bullet, \theta^*)$) possesses the MPS property. Let $\{x^k, \theta^k\}$ be computed via Algorithm 5.

Suppose (A1-3) holds. Then, the following holds:

$$\limsup_{k \to \infty} a_k \leq \frac{1}{2\mu_x} \gamma M^2 + \frac{L_\theta^2}{2\mu_x^2} \frac{\gamma \nu_\theta^2}{2\mu_\theta - \gamma C_\theta^2};$$

Suppose (A1-4) holds. Then, there exists a positive number α such that:

$$\limsup_{k \to \infty} \mathbb{E}[\operatorname{dist}(x^k, X^*)] \leq \frac{1}{\alpha} \left[\frac{1}{2} \gamma M^2 + \frac{1}{2} \gamma^{1-\tau} M_x^2 + \frac{\gamma^{\tau} \nu_{\theta}^2 L_{\theta}^2}{4\mu_{\theta} - 2\gamma C_{\theta}^2} \right],$$

ere 0 < \tau < 1.

Concluding remarks

A broad framework for resolving misspecified stochastic optimization/variational problems:

- Asymptotics for gradient/subgradient/extragradient/iterative regularization schemes for deterministic problems
- (a.s.) Asymptotics for stochastic approximation (and regularized counterparts) for stochastic problems
- Rate statements for gradient/subgradient schemes with quantification of impact; Similar statements for mean-squared error for stochastic approximation schemes

Key findings:

- Natural extensions of gradient-type schemes are provably convergent
- Recover optimal rates upto constant factor modifications in some regimes; degradation in other regimes.
- Seemingly non-monotone problems in full-space can be solved via first order schemes with modest rate degradation at worst

Ongoing work:

 Misspecified Markov Decision Processes (as an alternative to Q-learning) where transition matrices need to be learnt
