**Exercises for the lecture "Introduction to Computer Algebra"**

**Series 2. (Return on Monday, May 19th 2008)**

**Aufg. 1:** Consider the quadratic extension ring  $\mathbb{Z}[\sqrt{-5}] = \mathbb{Z} + \sqrt{-5}\mathbb{Z}$  with arithmetic operations as in  $\mathbb{C} \supset \mathbb{Z}[\sqrt{-5}]$ .

- (a) Examine whether  $\mathbb{Z}[\sqrt{-5}]$  is an integral domain. 4 pts.
- (b) Determine the group of units  $\mathcal{U}$ . 4 pts.
- (c) Show that  $a = 3(1 - \sqrt{-5})$  and  $b = 6$  have maximal common divisors  $c = 3$  and  $\tilde{c} = (1 - \sqrt{-5})$ , but neither  $c|\tilde{c}$  nor  $\tilde{c}|c$ . 4 pts.

**Aufg. 2:** Let  $\mathcal{R}$  be a g.c.d. domain. Prove that

- (a)  $\gcd(ca, cb) = c \gcd(a, b)$  for any  $a, b, c \in \mathcal{R}$ . 2 pts.
- (b)  $\gcd(\gcd(a, b), c) = \gcd(a, \gcd(b, c))$  for any  $a, b, c \in \mathcal{R}$ . 2 pts.
- (c)  $a = bq + r \implies \gcd(a, b) = \gcd(b, r)$  for any  $b, q, r \in \mathcal{R}$  2 pts.

**Aufg. 3:** Euclidean algorithm

- (a) Implement some variant of the (standard) extended euclidean algorithm for positive integers with smallest nonnegative remainder. Add in print statements that produce the extended quotient-remainder table for  $(a_k, q_k, u_k, v_k), k = 0, \dots, m$ , with 8 pts.

$$\begin{aligned} a_0 &= a, \quad a_1 = b, \\ a_{k-1} &= a_k \cdot q_k + a_{k+1}, \\ a_k \cdot u_k + a_{k+1} \cdot v_k &= \gcd(a, b). \end{aligned}$$

Or alternatively the table for  $(a_k, q_k, s_k, t_k)$  with

$$s_k a + t_k b = a_k.$$

Report those tables for the pairs  $(a, b) = (64\,879\,448\,976\,299, 2\,680\,241\,827\,180)$  and  $(a, b) = (579\,521\,240\,621\,427, 320\,385\,477\,230\,257)$

- (b) Show that for any given iteration count  $n$  in the euclidean algorithm, the smallest inputs realizing that count are the consecutive members of the Fibonacci sequence  $(a, b) = (F_{n+1}, F_n)$ . Deduce an estimate for the iteration count for any input. 4 pts.

- (c) Modify your implementation of the euclidean algorithm in such a way that it also accepts negative inputs and uses the smallest signed remainder, that is,  $-|a_k| < 2 \cdot a_{k+1} \leq |a_k|$ . Produce the same tables for the given inputs and compare their length. **6 pts.**
- (d) (Optional) Find a sequence of pairs  $((a^{(n)}, b^{(n)}))_{n \in \mathbb{N}}$  of integers such that no other pair of smaller absolute values than those of  $(a^{(n)}, b^{(n)})$  uses more than  $n$  iterations of the modified euclidean algorithm. **8\* pts.**

**Aufg. 4:** Lehmers algorithm for the computation of the gcd “guesses” the first quotients of the euclidean algorithm from the leading digits of the input numbers.

- (a) Compute and report the quotient sequence  $q_1, q_2, \dots, q_m$  for the (standard) euclidean algorithm starting with  $(a_1, b_1) = (880\,458\,755\,986, 307\,373\,752\,472)$ . Compare the first elements of this sequence with those of the quotient sequences for  $(88, 30)$ ,  $(89, 30)$  and  $(88, 31)$ , as well as those for  $(880\,458, 307\,373)$ ,  $(880\,459, 307\,373)$  and  $(880\,458, 307\,374)$ . (And similar for any number of leading digits of your choice.) **6 pts.**
- (b) Give an algorithm (without avoidable operations) to compute, given a pair  $(a \div B^m, b \div B^m)$  of leading digits, the leading segment of the quotient sequence up to the point of divergence. **4 pts.**
- (c) (Optional) Let  $C$  be some big number, e.g. some power of the digit base, and  $a = xC + z$ ;  $b = yC + w$  with  $x, y, z, w \in \{0, 1, \dots, C - 1\}$ ,  $x, y > 0$ . Show that if the quotient sequences  $q_1, \dots, q_k$  of the euclidean algorithm for the pairs  $(x + 1, y)$  and  $(x, y + 1)$  coincide, they also coincide with the quotient sequence for  $(a, b)$ . **8\* pts.**
- (d) (Optional) Expose a way to compute from the inputs  $(a_1, b_1)$  and  $q_1, \dots, q_{k-1}$  directly—that is, with as few biginteger operations as possible—the intermediate pair  $(a_k, b_k)$ . Use this procedure and the guessing of the first coefficients to complete an algorithm for the gcd computation à la Lehmer. **10\* pts.**
